UNICITY PROTOCOL · STRATEGIC PROPOSAL · 2026

SECURING THE AGENTIC ECONOMY.

When the counterparty is a machine, trust has to travel with the money.

PREPARED FOR
GREG KIDD @ HARD YAKA

THE MACRO SHIFT: THE COUNTERPARTY IS NOW A MACHINE.

Agents now negotiate, sign, and settle on their own — no human in the loop.

57.5%

OF GLOBAL WEB TRAFFIC IS NOW AUTOMATED — CLOUDFLARE, 2026

Legacy networks were built for human finance — they cannot check an agent's authority or hold it to a budget without a central chokepoint. Unicity binds the **proof of authority to the money itself**. It travels with every payment.

THE STRUCTURAL BOTTLENECK: THE SHARED LEDGER.

Shared ledgers were designed for humans — slow, sequential, contested. A permanent ceiling on scale and privacy.

Every node broadcasts, orders, validates, and records every transaction — one global queue that machine-speed commerce will never clear. Assets have to live off-chain. **Remove the shared ledger entirely.**

BROADCAST

Every node hears every transaction.

ORDER

Global agreement on the sequence of every one.

VALIDATE

Every node re-runs every one.

RECORD

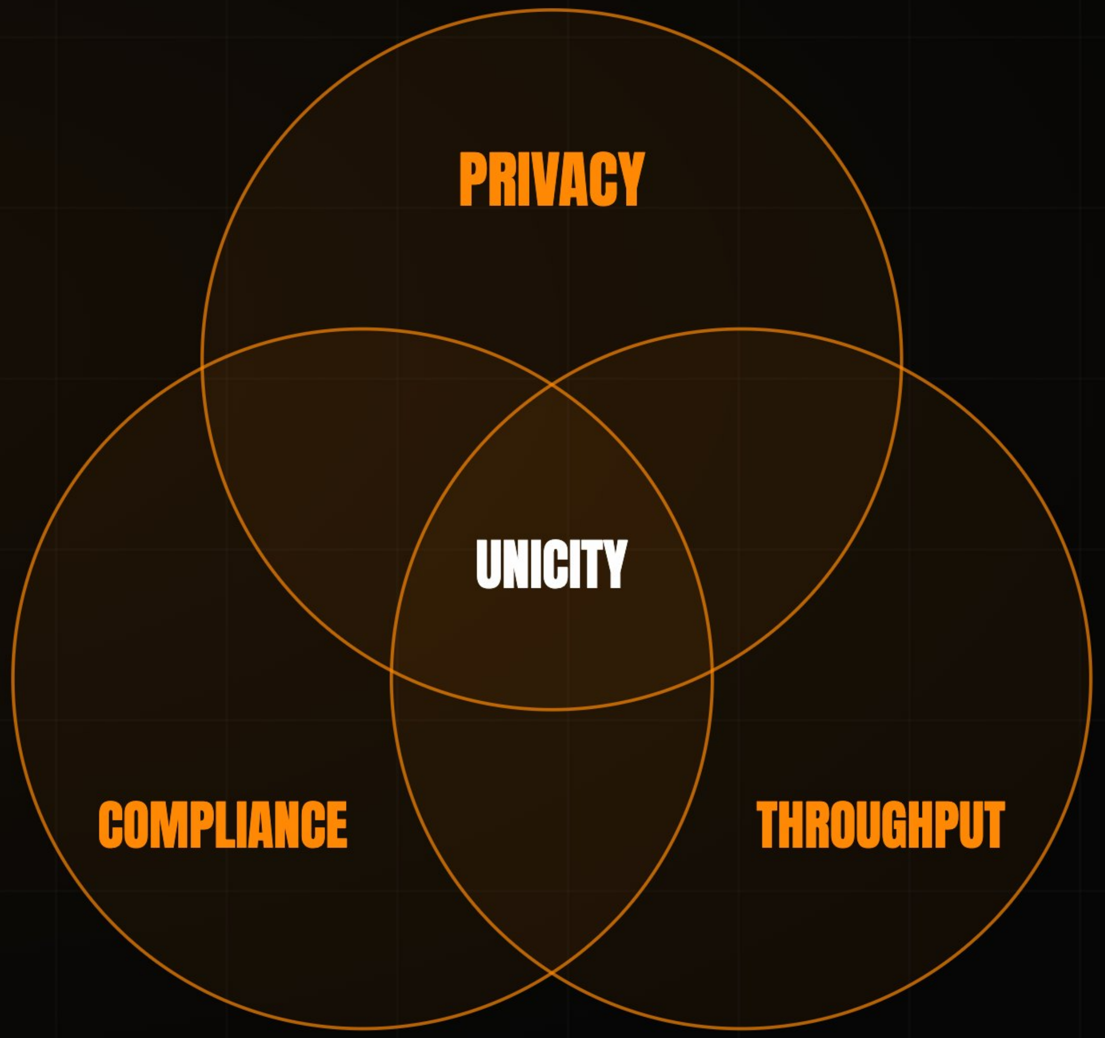
Every node stores the whole state, forever.

UNICITY

THE STABLECOIN TRILEMMA: PICK TWO.

Every digital-dollar design has been forced to sacrifice compliance, privacy, or throughput.

A public ledger gives you compliance and throughput — and exposes every balance. Add zero-knowledge and privacy returns, but the proving cost crushes throughput. Unicity holds **all three** — it never puts the transaction on a shared ledger to begin with.



THE FINAL INFRASTRUCTURE GAP: EMBEDDED IDENTITY.

We solved disintermediation. We solved digital value. We never solved knowing who is on the other end.

01	**DISINTERMEDIATION** Open infrastructure bypassed the legacy financial middleman.	SOLVED
02	**DIGITAL VALUE** Stablecoins now settle tens of trillions of dollars a year.	SOLVED
03	**CRYPTOGRAPHIC IDENTITY** No blockchain can natively verify a recipient's legal or operational standing before a transaction executes.	UNSOLVED

Identity is the permission to act — Unicity makes it enforceable inside the asset.

THE INCUMBENTS VALIDATE THE DIAGNOSIS.

The market spends billions working around the ledger. We removed it.

Every incumbent is working around the ledger they built — authorize in one place, settle in another, reconcile the audit trail across both. **Unicity keeps authorization, settlement, and the audit trail whole — inside the asset.**

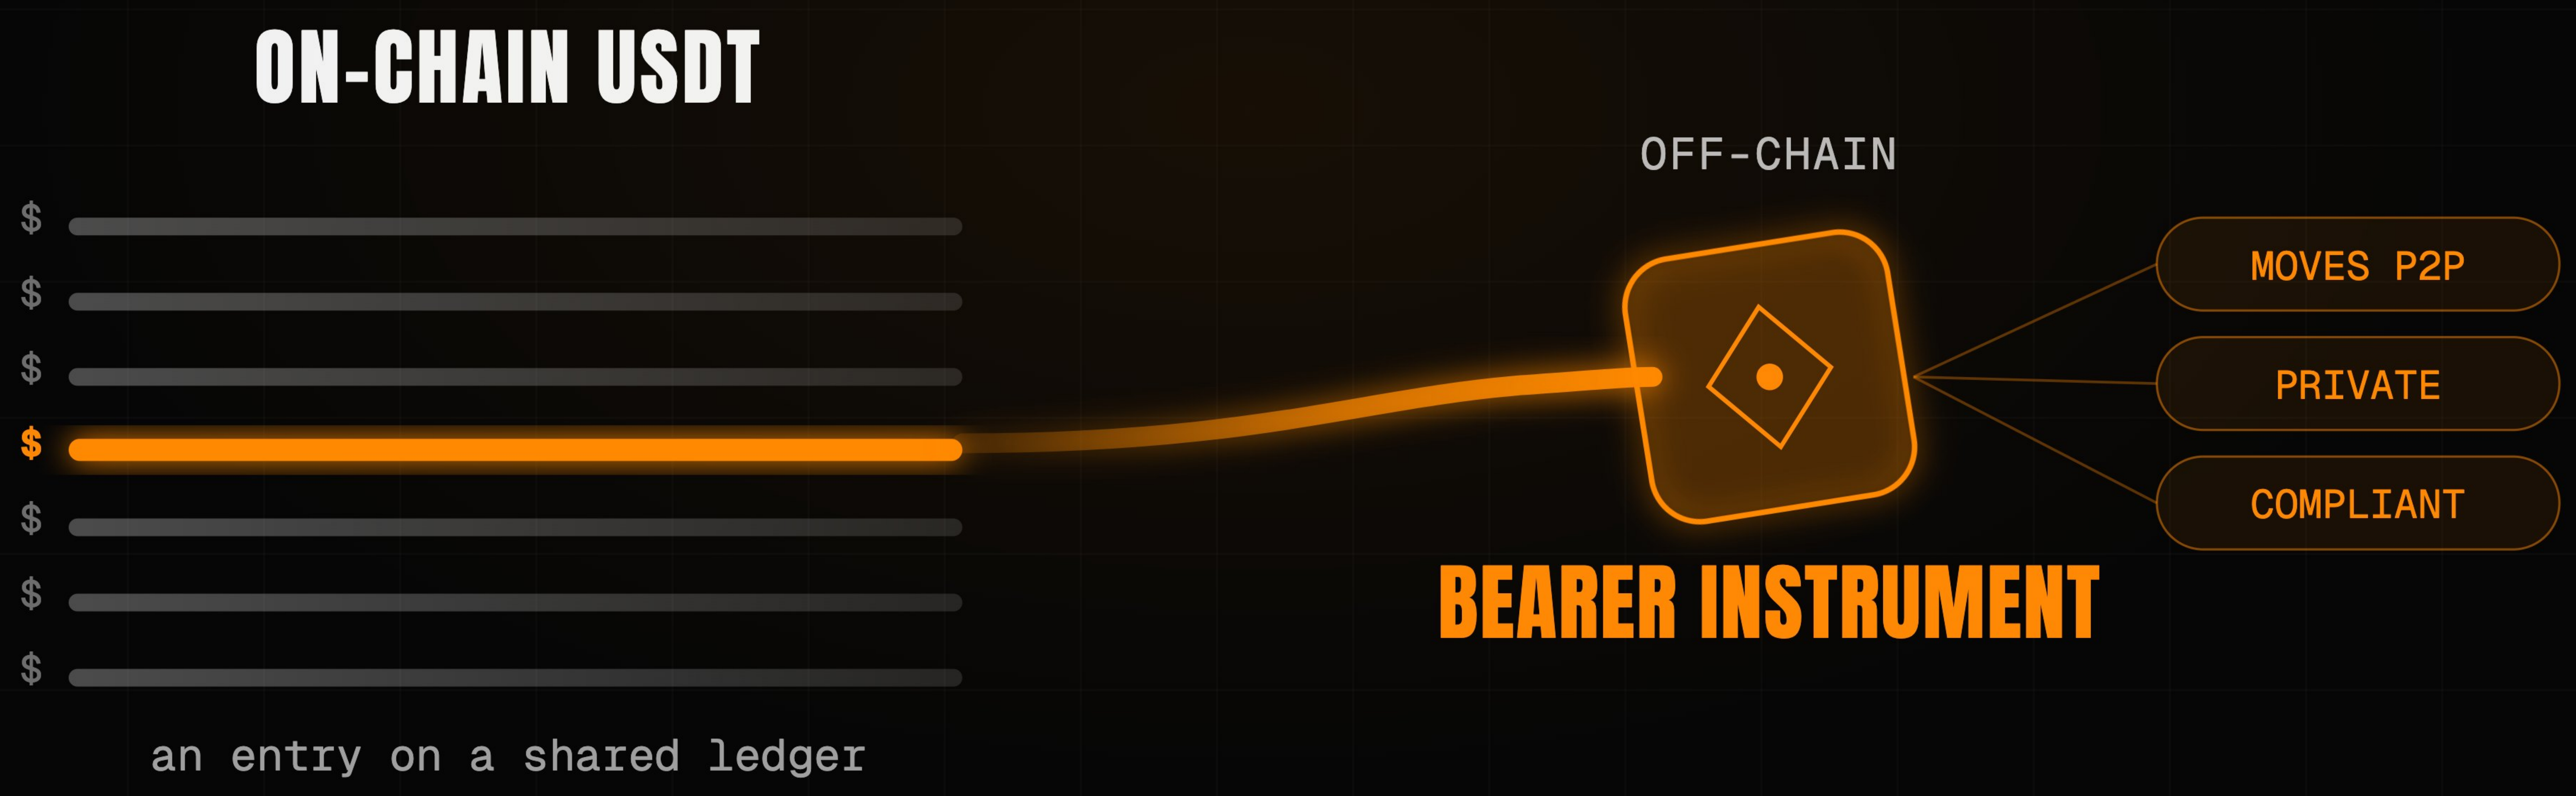
PLAYER	THEIR MOVE	APPROACH
CIRCLE	Pivoted to infrastructure — the Arc L1, a $222M presale, bought Malachite.	optimise the ledger
SOLANA	Alpenglow cut finality to ~150ms; its co-founder concedes a physical ceiling.	optimise the ledger
AP2 · X402	Authorize in one layer, settle in another — the proof splits across the stack.	split the proof
UNICITY	Keeps authorization, settlement, and the audit trail inside the asset.	keep it whole

UNICITY

FROM LEDGER ENTRIES TO BEARER INSTRUMENTS.

Off-chain settlement gives a digital dollar the properties of physical cash.

A stablecoin on a ledger is an entry someone else maintains. Unicity makes it a **bearer instrument** — self-contained, self-proving, carrying its own proof of validity. It moves **peer-to-peer** over any channel — HTTP, QR, NOSTR — with no ledger to call.



UNICITY

THE UNIQUENESS ORACLE: UNBUNDLING CONSENSUS.

Each generation of consensus removed work from the network. Unicity keeps only the irreducible function.

Everyone validating everything cannot scale. The **Uniqueness Oracle** attests to one thing — has this token been spent? It never re-runs a transaction or reads its contents. Add shards, add throughput: **30,000 transactions per second per shard, by design**.

CONSENSUS & EMISSION
decentralized base security

↓ certified state root

UNIQUENESS ORACLE
stores only proofs that token states are unique

↓ inclusion proofs

EXECUTION LAYER
agents and users transact client-side, off-chain

2009 · BITCOIN

CORRECTNESS + ORDERING
Every node certifies every transaction and agrees the global order.

2023 · SUI · FASTPAY

CORRECTNESS ONLY
Global ordering dropped for assets that share no state.

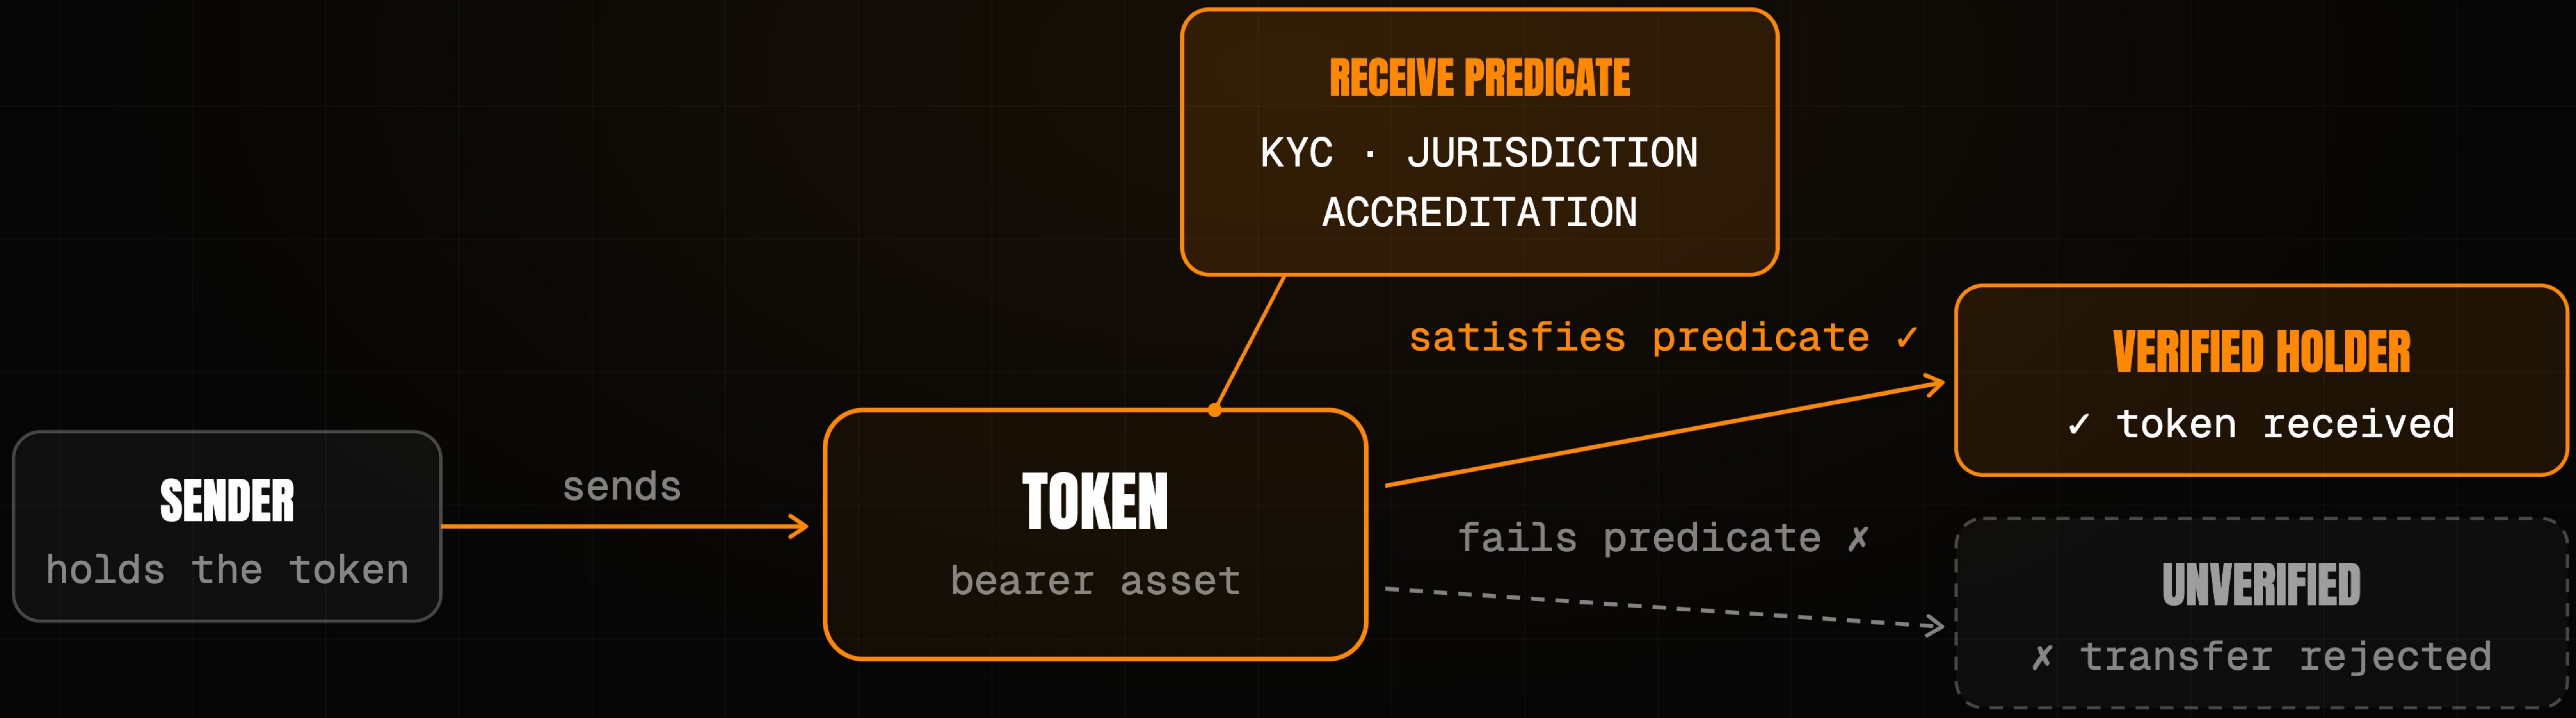
2026 · UNICITY

UNIQUENESS ONLY
The network attests one thing. Correctness moves to the edge.

PROTOCOL-ENFORCED COMPLIANCE: THE RECEIVE PREDICATE.

Cryptographically gating asset transfers without sacrificing peer-to-peer privacy.

Compliance does not need a central facilitator. The **Receive Predicate** programs KYC, jurisdiction, and accreditation into the asset itself. If the recipient cannot satisfy it, the transfer does not form. **The asset enforces its own compliance — nothing routes around it.**



PRIVACY BY CONSTRUCTION: PROVEN AGAINST EVERY OBSERVER.

Confidentiality is the floor for institutional capital.

Privacy is a founding property of the protocol — proven against all three observers: the network, the sender, anyone holding the address. Public ledgers expose all three. Unicity closes them by construction.

THE NETWORK	Sees only opaque commitments. It cannot read amounts, parties, or balances, nor link one transfer to the next.	PROVEN
THE SENDER	Cannot watch where or when the recipient later spends what was sent.	PROVEN
ANYONE WITH THE ADDRESS	Sees one published key; every sender derives a fresh, indistinguishable transaction key.	PROVEN

THE ATOMIC SWAP: SETTLEMENT WITHOUT AN INTERMEDIARY.

Trustless atomic swaps between self-contained bearer assets.

The usual fix is a timed lock — and the clock becomes the attack surface, where one side stalls and walks. **Predicate Swaps** remove the clock: both sides commit independently, and the swap forms for both or for neither. Off-chain, at machine speed — **no mempool, no MEV**.

HASHED TIMELOCK (HTLC)

1 · A locks, reveals hash y

2 · B locks against same y

3 · A claims, revealing preimage x

4 · B must claim before timeout

THE TIMING TRAP

B late on step 4 — a dropped connection — and A keeps both.

UNICITY PREDICATE SWAP

A COMMITS
locks their token

B COMMITS
locks their token

UNICITY SERVICE
the shared reference

AUTOMATIC FAIRNESS

- ✓ both locked → swap completes
- ✓ either walked away → both refunded
- ✓ no deadlines, no chasing, done

X402, REBUILT: TWELVE STEPS TO FIVE.

Eliminating the network friction that operators spend billions trying to solve.

x402 moves payment over HTTP — then routes it back through a facilitator and a public chain. Unicity puts the authorization and the proof inside the token. **The message is the payment.** Twelve steps become five — the friction operators like Square spend billions to solve, gone.

TRADITIONAL X402 — **12 STEPS**

1 Client requests the resource
2 Server returns 402 Payment Required
3 Client signs and submits payment
4 ~~Server forwards to facilitator~~
5 ~~Facilitator verifies on-chain balance~~
6 ~~Settle on the shared ledger~~
7 ~~Await block confirmation~~
8 ~~Facilitator confirms to server~~
… then deliver the resource

UNICITY X402 — **5 STEPS**

1 Client requests the resource
2 Server returns 402 Payment Required
3 Client pays with a bearer token (auth + proof inside)
4 Server verifies the token locally
5 Server delivers the resource

7 STEPS ELIMINATED

No facilitator. No shared ledger. No block wait.

UNICITY

THE MACHINE MARKET: VENUE-FREE TRADING.

CEX speed, DEX custody, with native privacy and compliance.

Every venue forces a trade. A CEX gives you speed and takes custody. A DEX gives you custody and takes privacy. Unicity gives you **all four – speed, custody, privacy, compliance** – with **no venue at all**.

	LEGACY CEX	LEGACY DEX	UNICITY
SPEED	sub-second	block time	sub-second
CUSTODY	custodial	self-custodial	self-custodial
PRIVACY	operator sees all	fully public	unlinkable
COMPLIANCE	off-chain	none	in the asset

WHAT GETS BUILT: THE AGENTIC CORPORATION.

Agents are the new smart contracts — verifiable logic running on the asset itself.

Unicity built a **weather-based parametric insurer** with no company behind it — capital, underwriting, and cession all execute as agents transacting in Unicity tokens. Settlement is only the entry point. **The same protocol runs the whole firm.**

BUILT BY INFRASTRUCTURE VETERANS.

Unicity Labs. PhDs in machine learning and cryptography, with fifteen years building security infrastructure for **DARPA, NATO, Lockheed, Verizon, and Maersk**. Now applying that to the money your agents move.

UNICITY

SHIP THE FIRST COMPLIANT DOLLAR.

A regulated dollar that settles peer-to-peer the moment the Receive Predicate is satisfied.

Co-design the Receive Predicate with a bank-regulated deposit issuer – the first dollar that settles the moment its counterparty clears.

Machines don't transact the way we do. Unicity embeds identity, permissions, and settlement directly into the digital asset.

Compliance has always lived in a walled garden. Put it inside the dollar, and you own the layer the agentic economy settles on.

UNICITY
