UNICITY

UNICITY PROTOCOL · STRATEGIC PROPOSAL · 2026

SECURING THE AGENTIC ECONOMY.

Proof of identity and permission, bound to the payment itself.

MIKE GAULT · CEO · mike@unicity-labs.com
ALAN RADI · COMMERCIAL · alan@unicity-labs.com

PREPARED FOR
GREG KIDD @ HARD YAKA

ACT I · THE SHIFT

THE AGENTS ARE HERE. THE RAILS ARE NOT.

They pay each other faster than any human rail can stop to ask who they are — or whether they should.

57.5%

OF WEB REQUESTS ARE AUTOMATED, NOT HUMAN — CLOUDFLARE, 2026

Legacy networks cannot verify an agent's authority or hold it to a budget without a centralized chokepoint. For machines to transact, the **proof of authority has to travel with the money**.

ACT II · WHY THE RAILS FAIL

A MACHINE CANNOT WAIT FOR A SHARED LEDGER.

Before one payment clears, **every node on earth** must hear it, agree where it falls in line, re-run it, and store it forever — the agent waits on a crowd of strangers reaching consensus.

Four jobs, repeated on every node, for every transaction — broadcast, order, validate, record. That is the tax the rail charges on each payment, and no machine moving at machine speed will pay it. The fix is not a faster ledger. It is **no shared ledger at all**.

BROADCAST

Every node hears every transaction.

ORDER

Global agreement on the sequence of all of them.

VALIDATE

Every node re-runs every one.

RECORD

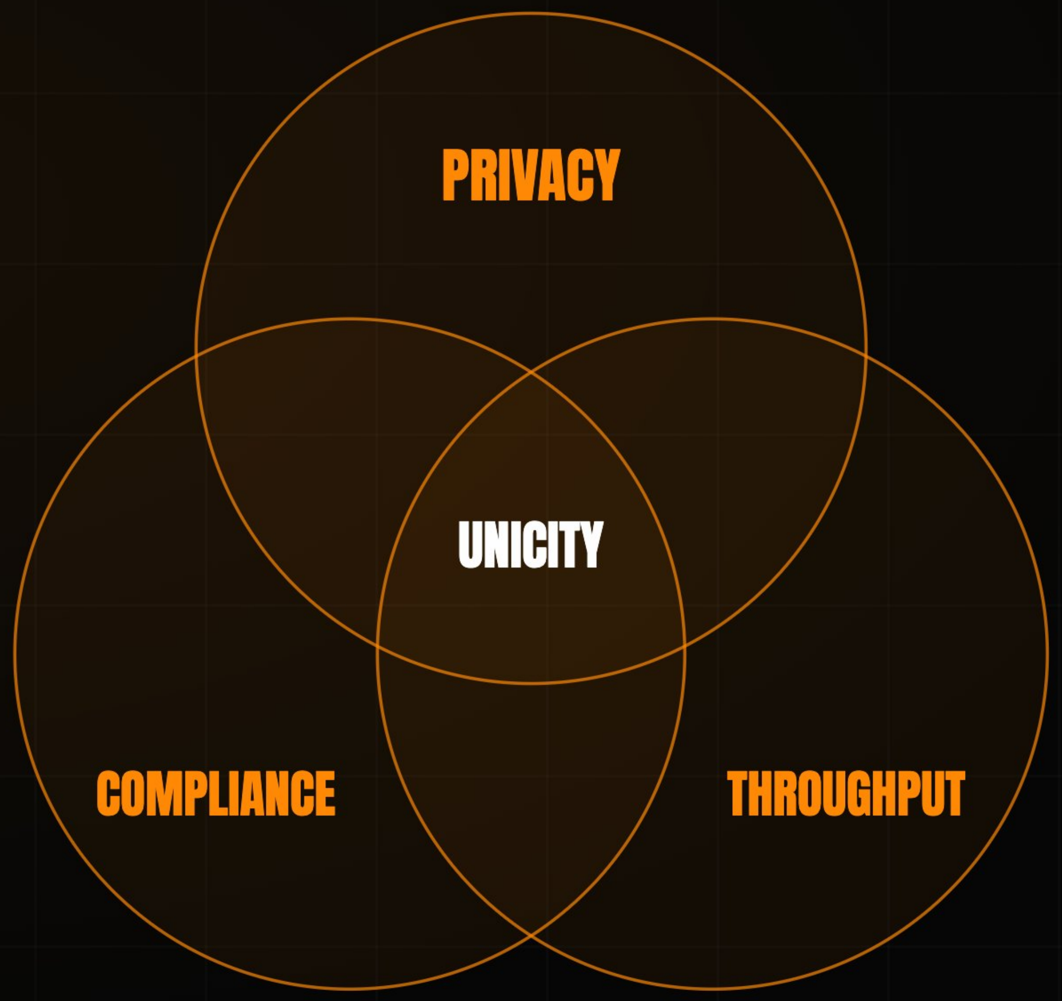
Every node stores the whole state, forever.

ACT II · WHY THE RAILS FAIL

EVERY DIGITAL DOLLAR TRADES ONE AWAY.

Verified, private, instantly settled — put a dollar on open rails and the design forces you to **surrender one of the three**.

The trade is not a choice — it is the shared ledger making it for you. Record every transfer in one place and you can have speed, or privacy, or proof of who is on the other end — **never all three at once**. Every dollar moving today already gave one up.



ACT II · THE GAP

TWO ARE SOLVED. ONE NEVER WAS.

Open rails removed the middleman. Stablecoins moved the value. But **proving who is on the other end — the question no rail could stop to ask — was never built.**

01	**DISINTERMEDIATION** Open infrastructure bypassed the legacy financial middleman.	SOLVED
02	**DIGITAL VALUE** Stablecoins now settle tens of trillions of dollars a year.	SOLVED
03	**CRYPTOGRAPHIC IDENTITY** No blockchain can natively verify a recipient's legal or operational standing before a transaction executes.	UNSOLVED

Unicity was engineered to close this last gap — counterparty verification, native to the asset.

UNICITY

ACT II · THE GAP

WHICH IS WHY IDENTITY KEEPS FAILING.

Bolt the check onto the side of the transaction, and the money just flows past it — a step that can be skipped gets skipped.

Every prior fix put identity **beside the asset** — a credential at the application layer, optional by construction, gone the moment the transfer routes around it. The proof has to live **inside the asset**, enforced in any jurisdiction, with nothing left to skip.

ACT II · THE STAKES

THE MARKET IS SPENDING BILLIONS — AND STILL MISSING IT.

Each one optimizes the ledger, or routes around it by splitting the proof across layers. They treat the symptom — the ledger itself is the flaw.

That spend is the validation: the problem is real and unsolved. **Unicity keeps authorization, settlement, and the audit trail whole, inside the asset.**

PLAYER	THEIR MOVE	APPROACH
CIRCLE	Pivoted to infrastructure — the Arc L1, a $222M presale, bought Malachite.	optimise the ledger
SOLANA	Alpenglow cut finality to ~150ms; its co-founder concedes a physical ceiling.	optimise the ledger
AP2 · X402	Authorize in one layer, settle in another — the proof splits across the stack.	split the proof
UNICITY	Keeps authorization, settlement, and the audit trail inside the asset.	keep it whole

ACT III · THE ANSWER

SO TAKE THE DOLLAR OFF THE LEDGER.

Make it carry its own proof — a digital dollar that settles like cash in hand, no ledger to ask permission.

Unicity turns an on-chain stablecoin into a **self-proving bearer instrument**. The proof of who holds it, and what it may do, travels inside the asset — so it moves **peer-to-peer** over any channel, HTTP, QR, NOSTR, with zero ledger lookups.

ACT III · THE ANSWER

SO THE NETWORK ATTESTS ONE THING.

Watch three generations throw work overboard. **Bitcoin** made every node re-check every transaction. **FastPay** dropped global ordering. **Unicity** keeps one question — **has this token been spent?**

The **Uniqueness Oracle** answers one question: has this token been spent? It never re-executes transactions or reads payloads, so throughput scales horizontally — **30,000 tx/sec per shard, by design.**

CONSENSUS & EMISSION
decentralized base security

↓ certified state root

UNIQUENESS ORACLE
stores only proofs that token states are unique

↓ inclusion proofs

EXECUTION LAYER
agents and users transact client-side, off-chain

2009 · BITCOIN

CORRECTNESS + ORDERING

Every node certifies every transaction and agrees the global order.

2023 · SUI · FASTPAY

CORRECTNESS ONLY

Global ordering dropped for assets that share no state.

2026 · UNICITY

UNIQUENESS ONLY

The network attests one thing. Correctness moves to the edge.

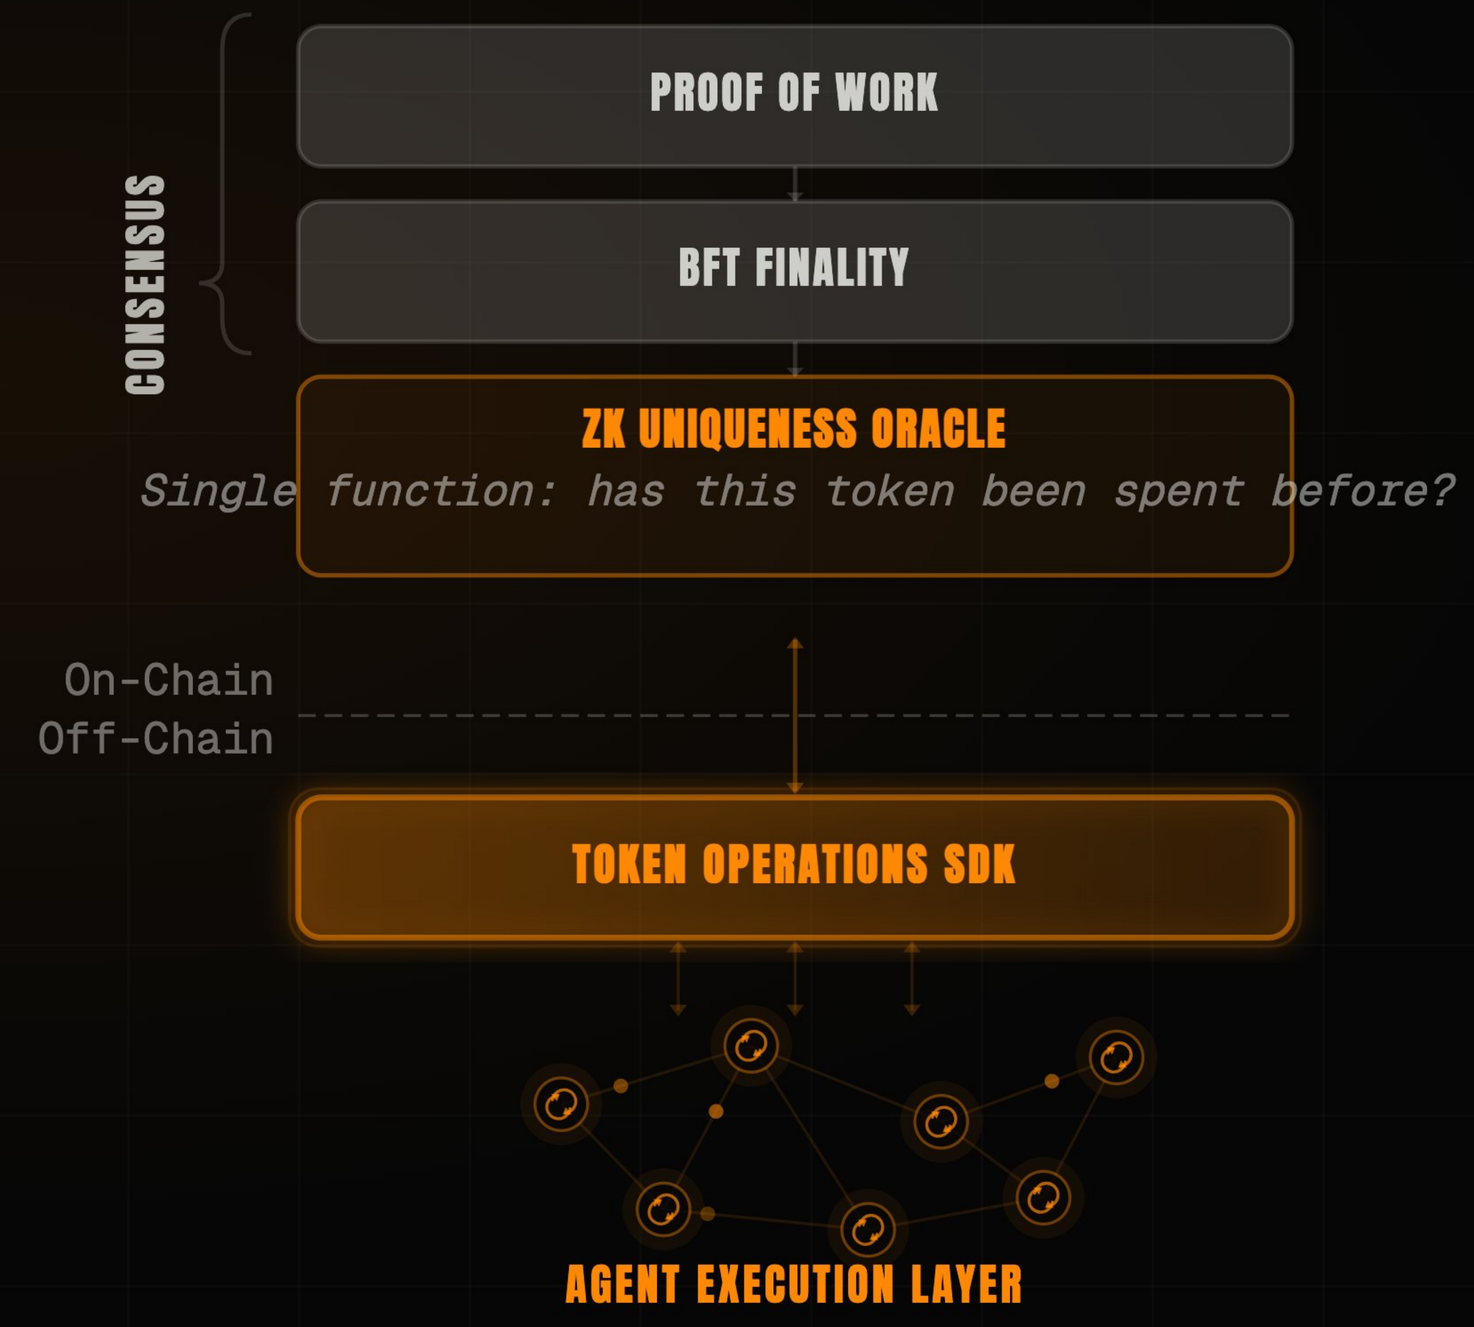
UNICITY

ACT III · THE ANSWER

SO THE CHAIN DOES ONE JOB.

Consensus secures the record and nothing more — **nothing an agent touches waits on it.**

Proof-of-work, BFT finality, and the ZK oracle keep the chain to a single task — anchoring the record. The SDK and the agent execution layer run beside it, never through it, so a payment, a swap, or a compliance check never queues behind a block. **The chain does one job — the economy runs off it.**

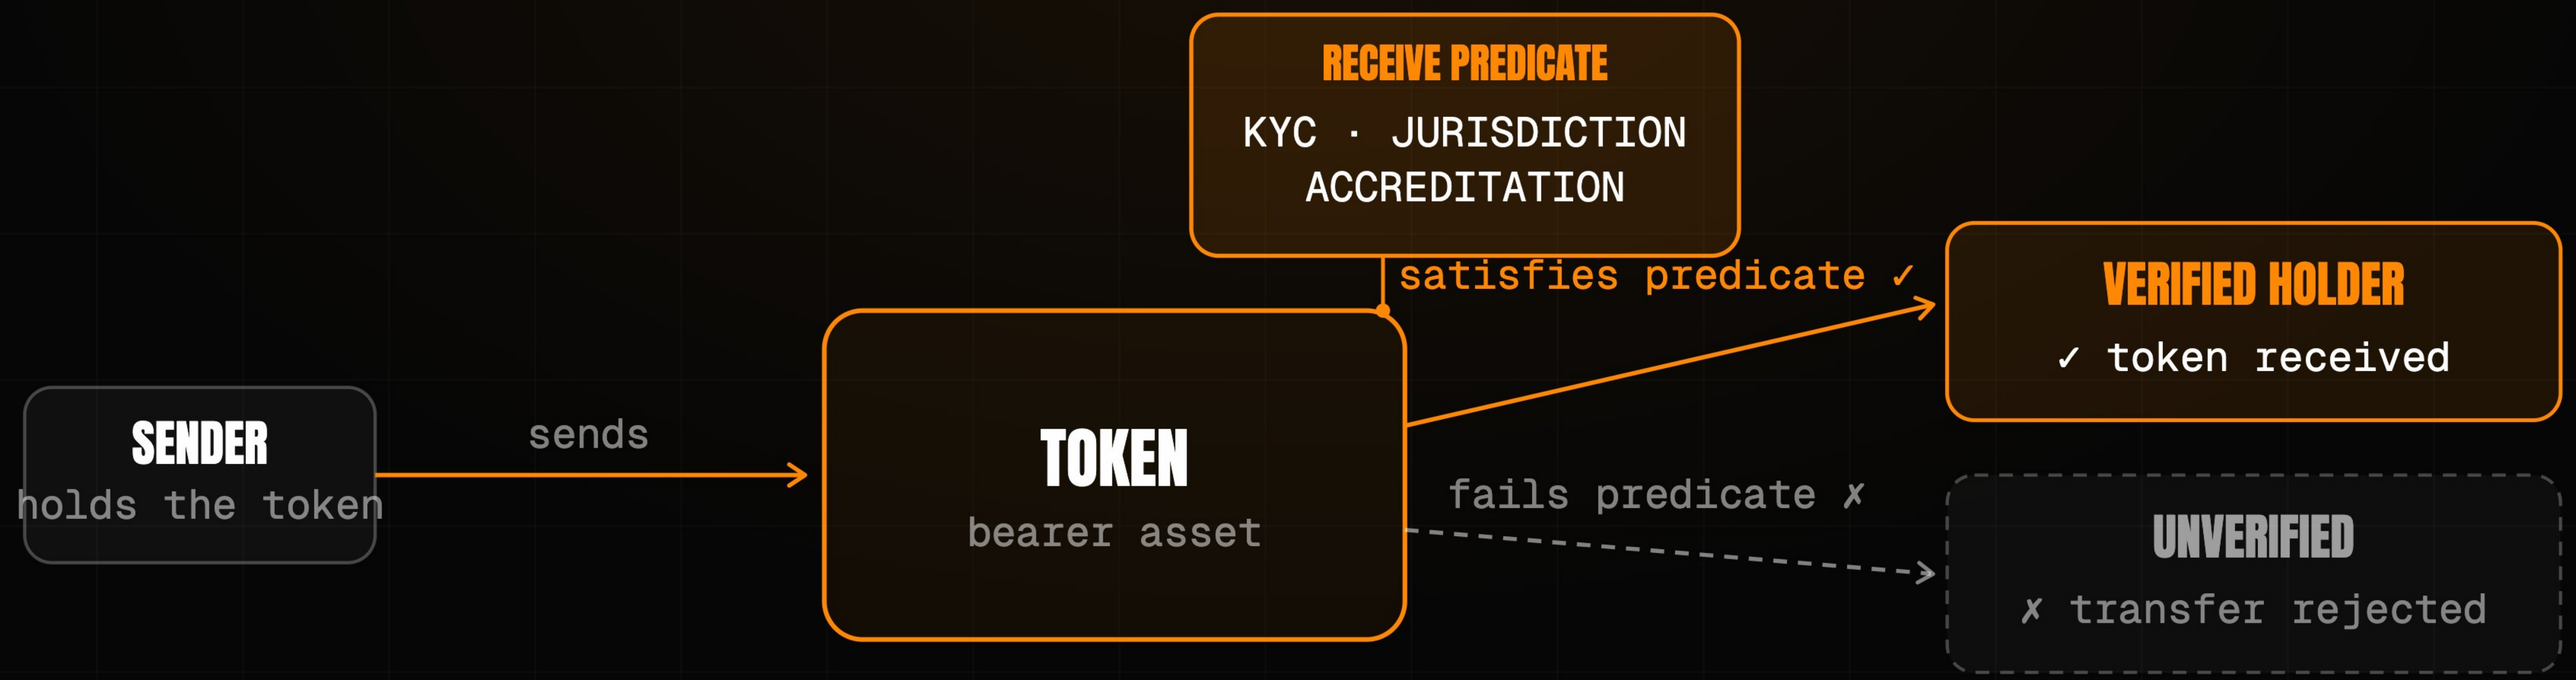


ACT III · THE ANSWER

NOW COMPLIANCE NEEDS NO MIDDLEMAN.

The asset itself asks **whether they should** — and refuses the wrong recipient, with no venue in the loop.

The **Receive Predicate** writes KYC, jurisdiction, and accreditation into the asset itself. Present it to a recipient who cannot satisfy the rule and the transfer will not resolve — it simply fails to land. **The dollar carries its own compliance, and enforces it on arrival.**



UNICITY

ACT III · THE ANSWER

AND THE OPEN LEDGER GOES DARK.

Three observers watch every public chain — the network, the sender, the address. None of them can see in.

Privacy here is proven, not promised — a founding property of the protocol, closed against all three. The City does not enter rails it can be read on; this is the floor that lets institutional capital move at all.

THE NETWORK	Sees only opaque commitments. It cannot read amounts, parties, or balances, nor link one transfer to the next.	PROVEN
THE SENDER	Cannot watch where or when the recipient later spends what was sent.	PROVEN
ANYONE WITH THE ADDRESS	Sees one published key; every sender derives a fresh, indistinguishable transaction key.	PROVEN

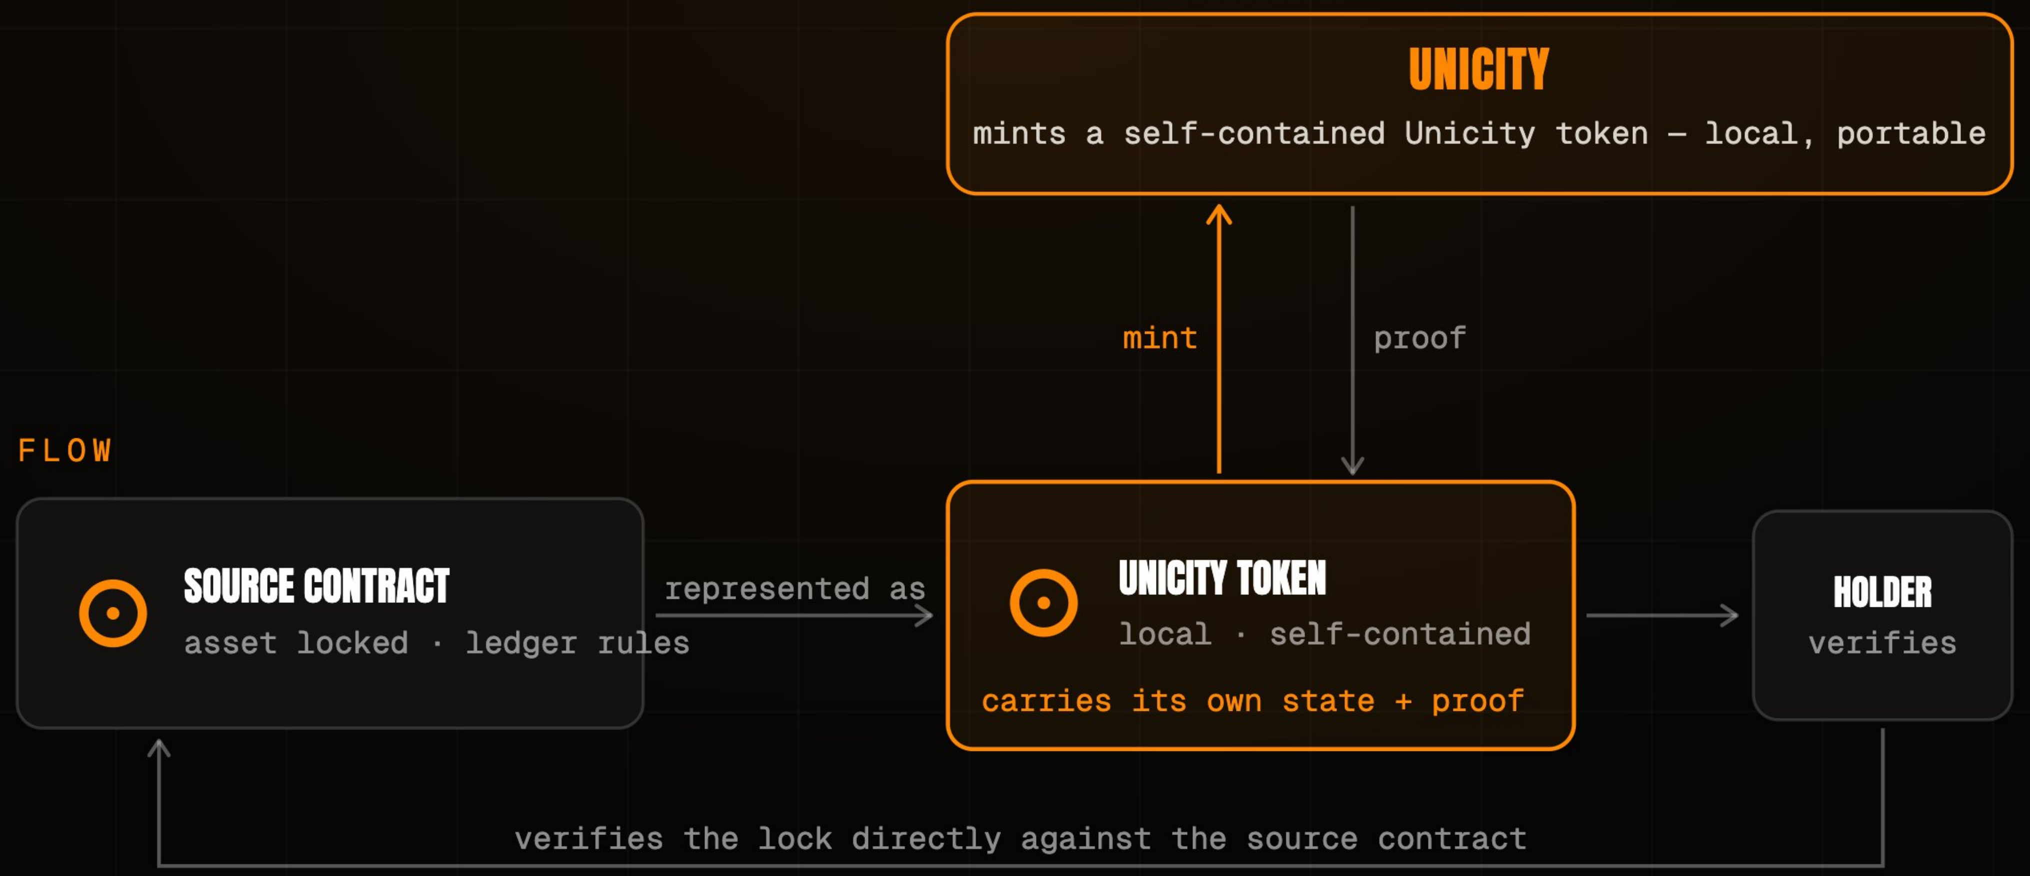
ACT III · THE ANSWER

NO BRIDGE, NOTHING TO HACK.

Every big crypto theft drains the same place — the bridge that **holds the pooled value.** So we built without one: **designed out, not patched.**

Bridges concentrate risk: they hold value and relay a forgeable message. Unicity holds nothing — a locked source-chain asset becomes a self-contained token the recipient verifies directly against the source contract.

FLOW



ACT III · THE ANSWER

SO THEY SETTLE WITH NO CLOCK TO ATTACK.

Atomic swaps between self-contained bearer assets — no timed lock, no intermediary.

Every other swap leans on a timed lock, and the clock is the attack surface — one side stalls, waits it out, and walks with both legs. **Predicate Swaps** remove the clock: each side commits independently, and the swap forms for both **at once or not at all**.

HASHED TIMELOCK (HTLC)

1 · A locks, reveals hash y

2 · B locks against same y

3 · A claims, revealing preimage x

4 · B must claim before timeout

THE TIMING TRAP

B late on step 4 — a dropped connection — and A keeps both.

UNICITY PREDICATE SWAP

A COMMITS
locks their token

B COMMITS
locks their token

UNICITY SERVICE
the shared reference

AUTOMATIC FAIRNESS

✓ both locked → swap completes
✓ either walked away → both refunded
✓ no deadlines, no chasing, done

ACT III · THE ANSWER

TWELVE STEPS **BECOME FIVE.**

Watch the handshake collapse — seven steps drop out, and the friction operators spend billions on is simply gone.

The seven dead steps are the split itself — facilitator, shared ledger, block wait, the proof handed layer to layer. Unicity puts authorization and proof inside the token, so the handshake **shrinks from twelve to five** and nothing leaves the asset.

TRADITIONAL X402 — **12 STEPS**

1 Client requests the resource
2 Server returns 402 Payment Required
3 Client signs and submits payment
4 ~~Server forwards to facilitator~~
5 ~~Facilitator verifies on-chain balance~~
6 ~~Settle on the shared ledger~~
7 ~~Await block confirmation~~
8 ~~Facilitator confirms to server~~
… then deliver the resource

UNICITY X402 — **5 STEPS**

1 Client requests the resource
2 Server returns 402 Payment Required
3 Client pays with a bearer token (auth + proof inside)
4 Server verifies the token locally
5 Server delivers the resource

7 STEPS ELIMINATED

No facilitator. No shared ledger. No block wait.

UNICITY

ACT III · THE ANSWER

A MARKET WITH NO VENUE.

Every other column gives one up. **Read the last one straight down — nothing does.**

The whole market still has to **pick two** — speed or custody, privacy or compliance — because a venue sits in the middle. Take the venue out and the trade-off has nowhere to live: **one dollar that holds all four at once**.

	LEGACY CEX	LEGACY DEX	UNICITY
SPEED	sub-second	block time	sub-second
CUSTODY	custodial	self-custodial	self-custodial
PRIVACY	operator sees all	fully public	unlinkable
COMPLIANCE	off-chain	none	in the asset

UNICITY

ACT III · THE ANSWER

AND A WHOLE COMPANY RUN BY AGENTS.

No desk, no operator — the agents *are* the company, and the same protocol carrying the dollar carries them.

Unicity built a decentralized autonomous corporation for BlackRock — a parametric insurer whose capital, underwriting, and cession all run as agents. Settlement is only the entry point: **the same protocol runs the whole corporation**.

UNICITY

THE TEAM

BUILT BY INFRASTRUCTURE VETERANS.

Unicity Labs. PhDs in machine learning and cryptography with fifteen years building nation-state-grade security infrastructure for **DARPA, NATO, Lockheed, Verizon, and Maersk**. Now applying that to the rails your agents transact on.

Mike Gault

CEO

- PhD Electrical Engineering
- Built & exited Guardtime (ADX:IHC)
- Ex-MD, Barclays Capital

Tony Kenyon

CTO

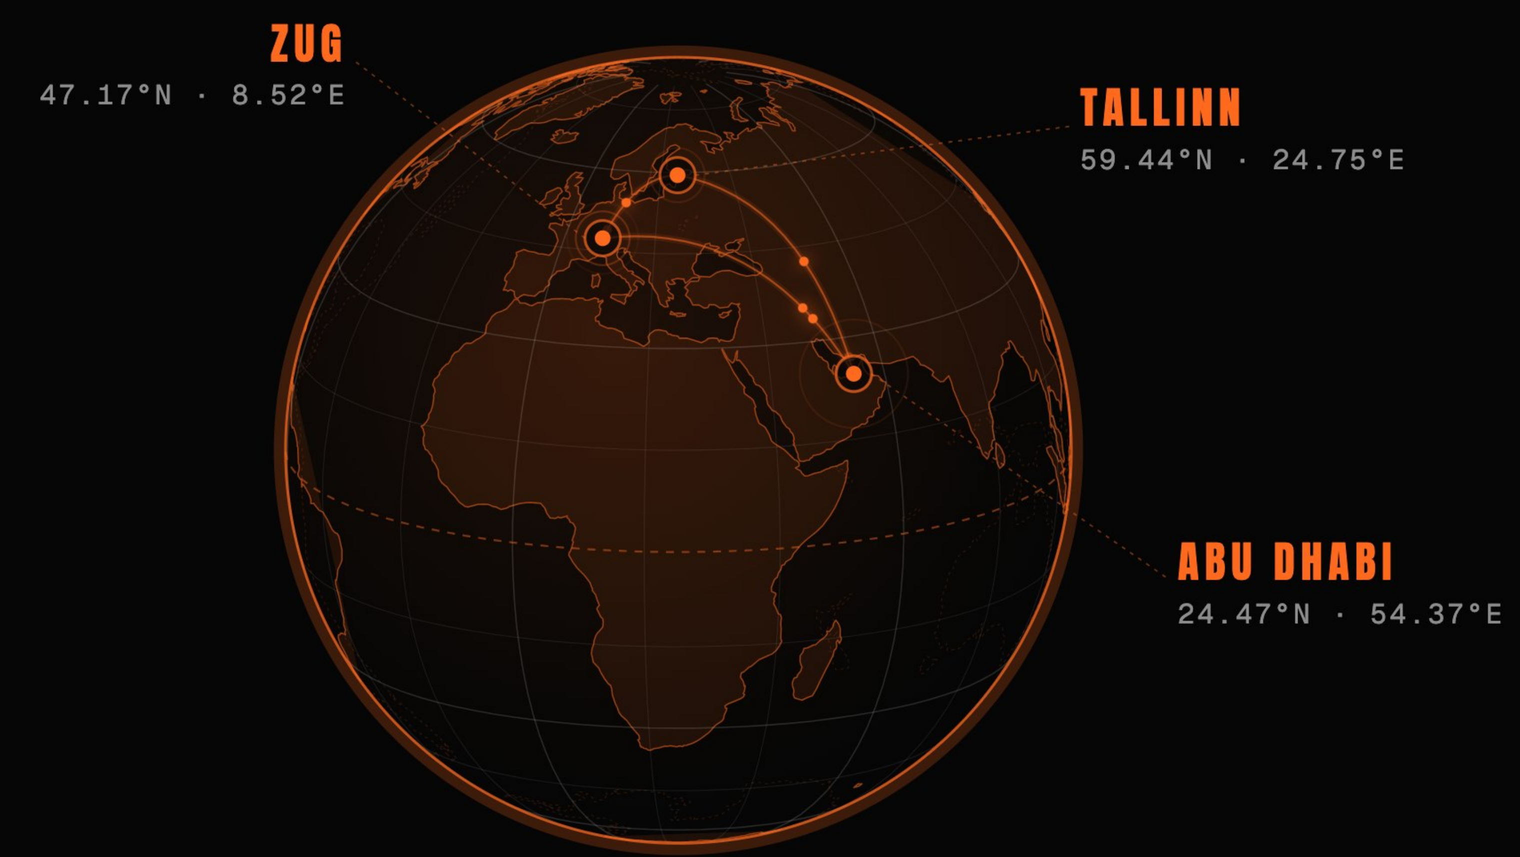
- PhD Machine Learning
- 25 years shipping enterprise AI & infra
- Principal Architect: BT, Nokia, A10

Alan Radi

COMMERCIAL

- 12 years implementing CX AI for Global B2C brands
- Apple · Google · Verizon · Pepsi · DHL

WHERE WE OPERATE



CRYPTOGRAPHIC INFRASTRUCTURE TRUSTED BY

NATO OTAN · DARPA · LOCKHEED MARTIN · verizon · BIS · MAERSK · esa European Space Agency

UNICITY

ACT IV · THE NEXT STEP

SHIP THE FIRST COMPLIANT DOLLAR.

A regulated dollar that settles peer-to-peer the moment the Receive Predicate is satisfied.

Partner with a regulated issuer to bind identity, speed, and settlement into one instrument.

The first asset where the proof of who you are — and what you may do — travels with the money itself.

Compliance has always lived in a walled garden. Put it inside the dollar, and you own the rail the agentic economy settles on.

UNICITY
